Computer Engineering Student • Software Engineering Intern Candidate

4th-year Computer Engineering student at Istanbul Kültür University with project experience in mobile development (Flutter/Dart), embedded systems (IoT), and object-oriented programming in Python, C, and C++. Completed an Erasmus+ exchange semester at VSB–Technical University of Ostrava (Faculty of Electrical Engineering and Computer Science). Looking for a software engineering internship where I can apply classroom knowledge to real engineering problems and keep improving.

WORK EXPERIENCE

Microsoft Azure Developer Community

06/2026 – 07/2026

Microsoft Azure Developer Community provides hands-on training and technical programs that help developers build modern applications using Microsoft's cloud and AI technologies, including Azure AI and Microsoft Foundry Local.

AI Innovator – Summer Training Participant • Internship

Remote

Selected for an exclusive one-month AI Innovator training program focused on building private, local AI applications using Microsoft Foundry Local. Developed an end-to-end Retrieval-Augmented Generation (RAG) AI assistant with Python and local LLMs, enabling secure, cloud-independent contextual document retrieval. Applied modern AI engineering practices including prompt engineering, local model deployment, and AI application architecture while completing the program's capstone project.

EDUCATION

B.Sc. Computer Engineering in Computer Engineering

Istanbul Kültür University • GPA: 3.04

Istanbul, Türkiye • 09/2023 – Expected 07/2027

- Data Structures & Algorithms
- Object-Oriented Programming
- Operating Systems
- Computer Networks
- Machine Learning
- Embedded Systems & IoT
- Mobile Programming
- Project Management (PMBOK)

Erasmus+ Exchange

VSB – Technical University of Ostrava

Ostrava, Czech Republic • 09/2025 – 01/2026

Faculty of Electrical Engineering and Computer Science. Erasmus+ exchange — evidence of adaptability, cross-cultural collaboration, and academic initiative.

PROJECTS

Local RAG AI Assistant | Python • Microsoft Foundry Local

06/2026 – 07/2026

Microsoft

- Architected and developed a fully local **Retrieval-Augmented Generation (RAG)** AI assistant that performs contextual document retrieval and intelligent question answering without relying on external cloud AI services.
- Integrated **Microsoft Foundry Local**, Python, and local LLMs to build a privacy-first AI pipeline capable of ingesting, indexing, retrieving, and generating responses from custom knowledge sources.

- Built as the capstone project of Microsoft's AI Innovator Summer Training Program

Campus Lost & Found – Mobile Application

- Designed and built a cross-platform Flutter mobile app enabling students to report lost items and browse found-item listings with search and filter functionality.
- Implemented a structured data model to track item state (lost → found → claimed), giving me practical experience with data modelling and state management.
- Focused on intuitive UX flow and component reusability, applying OOP principles and Flutter widget composition patterns.

HPC Temperature Alert System

- Designed and implemented an embedded IoT monitoring system for high-performance computing environments that continuously reads thermal sensors and triggers configurable alerts on threshold breach.
- Implemented threshold-based alert logic that triggers notifications when sensor readings exceed defined limits, focusing on reliability and low-latency response.
- Explored hardware-software interfacing and real-time sensor polling as part of the embedded systems coursework underpinning the project.

Risk Management Interactive Game

- Developed an interactive educational game translating PMBOK risk management concepts (risk identification, analysis, response planning, monitoring) into structured game mechanics.
- Designed branching decision logic and a scoring system to simulate real project risk scenarios, demonstrating software design and game-loop architecture skills.
- Went through a full build cycle—requirements, design, implementation, and iterative testing—which gave me a clearer picture of how software projects actually move.

Algorithms & Data Structures Practice Suite

- Implemented 20+ algorithmic problems and data structure exercises (linked lists, trees, sorting, and recursion) as part of coursework and independent study.
- Strengthened problem-solving skills in C/C++ with focus on memory management, pointer arithmetic, and time complexity analysis.

SKILLS

Languages: C, C++, Dart, GDScript, Python

Mobile / UI: Cross-platform app development, Dart UI, Flutter

Paradigms: Data Structures & Algorithms, Event-driven design, OOP

Embedded / IoT: Alert systems, Hardware-software interfacing, Sensor integration

Tools & Env.: Git, GitHub, VS Code

ML / Data: Machine Learning fundamentals

Soft Skills: English (professional), Persian (native), Turkish (Intermediate)
